BEGINNER'S COMPLETE GUIDE — NO TECH BACKGROUND NEEDED

Your AI Trading Bot: How It Works & How to Use It

A plain-English walkthrough of the 5-Agent automated trading system built for Delta Exchange crypto perpetual futures. Start safely, trade confidently.

5	1%	2:1	0 😮
AI Agents Working Together	Max Risk Per Trade	Min Reward/Risk	Blind / Naked Trades

🤔 What Is This Bot — In Plain English?

Most people lose money trading crypto because they let **emotions** drive their decisions — buying when everyone is excited (usually near the top), selling in panic when the price drops, and risking too much money on a single bet.

This system fixes all of that. It is a fully automated trading bot connected to **Delta Exchange** — a licensed crypto exchange. It uses **5 specialized AI helpers** working like a professional trading team.

> 💡 **The Simple Version**
>
> The bot scans Bitcoin, Ethereum, Solana, and XRP prices every few minutes. When it finds a good opportunity, it automatically: checks your wallet, calculates the safe bet size, places the order, and attaches an automatic emergency exit — all without you needing to watch the screen.

📖 10 Words You Need to Know

📈 Long (Buy)
Betting the price will **go up**.
Like buying shoes hoping resale value rises.

📉 Short (Sell)
Betting the price will **go down**.
Like selling summer stock before winter.

🛑 Stop-Loss (SL)
Auto-exits trade to **limit your loss**.
Like a car airbag. Small bump, not a total crash.

🎯 Take-Profit (TP)
Auto-exits trade to **lock in profit**.
Like a sell alarm at your target price while you sleep.

🎁 Bracket Order
Entry + Stop-Loss + Take-Profit sent **all at once**.
Like a flight ticket with travel insurance already included.

🆓 Breakeven Stop
Moving your Stop-Loss to your **purchase price**.
A free lottery ticket. Loss = $0, Win = Profit. You can't lose.

⚡ Leverage (5x)
Trade **5× your balance** using exchange credit.
Like a small deposit controlling a bigger house purchase.

⚠️ Liquidation Price
The price where the exchange **force-closes** your trade.
Bot always keeps this price safely far away (20%+ buffer).

🕯️ Perpetual Future
A crypto contract with **no expiry date**.

🧠 Market Regime
The overall market **mood or direction**.

You can hold a Bitcoin position for as long as you want.

Sunny (Bullish) vs Stormy (Bearish) vs Foggy (Neutral).

🤖 Your 5-Person AI Trading Team

Instead of one AI making all the decisions, this system divides the work among **5 specialized agents**. Think of them as 5 different people, each with one job. No agent can override another's safety rules.

🔍 **AGENT 1 — THE SCOUT**

Market Regime & Technical Analyst

What it looks at: The last 100 hours of Bitcoin, Ethereum, Solana, and XRP price history. It calculates trend lines, price momentum, and how volatile (choppy) the market is.

What it outputs: A simple verdict like "*Bitcoin is STRONG BULLISH*" or "*XRP is STRONG BEARISH — market is falling.*"

Critical Rule: The Scout is *read-only*. It never places orders. It only reports what it sees.

↓

💡 **AGENT 2 — THE PLANNER**

Strategy & Setup Generator

What it does: Reads the Scout's report and searches for a smart entry point.

The 2-for-1 Rule: Every trade idea must have a clear path to earn at least **$2 in profit for every $1 risked**. If no such setup exists, the Planner stays quiet — no trade is generated.

What it outputs: A specific proposal: "*Buy Bitcoin at $80,950. Safety exit at $79,350. Profit target at $81,760.*"

↓

🛡️ **AGENT 3 — THE RISK BOSS (MOST IMPORTANT!)**

Risk & Discipline Gatekeeper

Why it matters most: The Risk Boss has *absolute veto power*. No trade can proceed without its approval.

Its 3 strict checks:

① "*Did we already lose 5% of the account today?*" → If yes: **ALL TRADING STOPS for the day.**
② "*Do we already have 3 active trades?*" → If yes: **REJECTED. Too crowded.**
③ "*Would this trade risk more than 1% of our balance?*" → If yes: **REJECTED. Too big.**

What it outputs: A green **[APPROVED]** stamp (with exact contract size) or a red **[REJECTED]** stamp.

↓ Only if APPROVED

🚀 **AGENT 4 — THE PILOT**

Execution & Order Manager

What it does: Takes the approved trade plan and communicates directly with Delta Exchange to place the order.

How it places orders: It sends a *3-in-1 Bracket Order*. In a single action, it places:

- Your **entry** order (buying Bitcoin at the right price).
- An automatic **Stop-Loss** order (emergency exit to prevent big loss).
- An automatic **Take-Profit** order (target exit to lock in winnings).

Safety Rule: The Pilot *refuses to place any order without an attached Stop-Loss.* Never a naked trade.

↓

📊 **AGENT 5 — THE ACCOUNTANT**

Portfolio Monitor & Memory Journaler

What it does: Once a trade is running, the Accountant watches it live. When the price moves far enough into profit, it triggers the *Breakeven Protocol*: it moves the Stop-Loss up to your exact purchase price.

Result: You now have a **"Free-Roll"** — the worst case is you break even ($0 loss). Best case, the price keeps moving and you collect the full profit.

It also writes a diary: Every trade detail is saved to `state/trade_journal.json` and a daily summary is generated in `reports/`.

🚀 How to Set Up & Use the Bot (Step-by-Step)

> ☝️ **Start on Demo (Testnet) First!**
> Before using your real money, always start on **Delta Testnet** — a risk-free demo environment with fake money. The bot is already configured for Testnet by default. Only switch to live trading after you feel fully comfortable.

Step 1 — Get Your Demo API Keys from Delta Exchange

1

Create a Testnet Account

Go to **testnet.delta.exchange** and sign up with your email. This is a completely separate (practice) account from real Delta Exchange.

2

Get Free Demo Money

After logging in, click **Deposit** → **Faucet** to add free practice USD to your testnet wallet (usually $100–$1,000 of fake money).

3

Generate API Keys

Go to **Settings** → **API Keys** → **Create New API Key**. Enable only **Read** and **Trade** permissions. NEVER enable Withdraw. Copy both the API Key and API Secret (shown only once!).

Step 2 — Save Your Keys in the Bot's Config File

Open the file `.env` in the project folder and fill it in:

FILE: .ENV (YOUR SECRET CONFIG FILE)

```
DELTA_ENVIRONMENT=testnet_india DELTA_BASE_URL=https://cdn-ind.testnet.deltaex.org
DELTA_API_KEY=paste_your_api_key_here DELTA_API_SECRET=paste_your_api_secret_here # Risk
Controls (keep these as-is for safety) MAX_RISK_PER_TRADE_PCT=0.01 ← Only 1% risk per trade
MAX_DAILY_DRAWDOWN_PCT=0.05 ← Stop trading if down 5% MAX_ALLOWED_LEVERAGE=10 ← Max 10x
leverage ceiling MIN_REWARD_TO_RISK_RATIO=2.0 ← Minimum 2:1 profit target
```

Step 3 — Test Your Connection

Open a terminal in the project folder and run:

TERMINAL COMMAND

```
python test_delta_connection.py
```

```
✅ [SUCCESS] Connected to Delta Exchange. Cached 599 products. ✅ [SUCCESS] BTCUSDT Ticker: Latest Price
= $80,157.00 ✅ [SUCCESS] Authenticated! Wallet: USD = $204.83 available
```

Step 4 — Choose How You Want to Use the Bot

Mode	Terminal Command	What Happens	Best For
Interactive Mode	`python main.py interactive`	Bot analyses, calculates sizing, and asks your confirmation **[y/N]** before any order.	🟢 **Best for Beginners!**
Market Scan Only	`python main.py scan`	Bot scans all 4 coins and shows you what it would do — but places nothing.	Learning / Understanding
Auto-Pilot	`python main.py auto`	Bot runs every 5 minutes, places approved trades on its own without asking.	Experienced users
Daily Report	`python main.py digest`	Shows your portfolio: open positions, unrealized profit/loss, and stats.	Daily check-in

Step 5 — How a Trade Confirmation Looks in Interactive Mode

WHAT YOU'LL SEE ON-SCREEN WHEN A TRADE IS FOUND

```
👹 [MULTI-AGENT TEAM] Analysis Cycle Started... 🔍 [Agent 1] BTC Regime: STRONG_BULLISH (RSI: 55.7 | Price: $81,061) 💡 [Agent 2] Setup: Trend_Continuation_Long (R:R = 2.0:1) 🛡️ [Agent 3] APPROVED — 1 contract | Risk: $0.80 (0.39% equity) 🚀 [Agent 4] Ready to Execute: Symbol : BTCUSDT (Buy / Long) Entry : $80,957.50 Stop-L : $79,355.40 ← Your safety exit if wrong Target : $81,760.10 ← Your profit cash-out Risk : $0.80 max loss if stop is hit Reward : $1.60 potential gain (2:1) ❓ Confirm order on Delta Exchange? [y/N]: _
```

Type **y** to execute it, or just press **Enter / n** to skip. If you skip, your money is completely untouched.

💬 Talk to the Bot in Plain English (No Commands Needed!)

Because this bot is connected to Claude/Antigravity via MCP, you can **have a conversation** with it right here in chat. Examples of things you can say:

What You Want	What to Type in Chat
Check my wallet balance	*"Check my Delta Exchange wallet and show my balance."*
See open trades	*"Show my current open positions and profit/loss."*
Analyse Bitcoin	*"Analyse BTCUSDT — is the market bullish or bearish right now?"*
Get a trade suggestion	*"Find me a safe trade setup on ETHUSDT with 2:1 profit target."*
Move stop to breakeven	*"Move my Bitcoin stop-loss to breakeven so I can't lose."*
Close everything now	*"Cancel all my orders and close all my positions immediately."*

🎯 The Real Trade We Executed on Your Demo Account

Here is the exact story of the Bitcoin trade executed live on your Delta Testnet account today:

STEP 1 — ACCOUNT CHECK
Starting balance: **$204.83 USD** in demo wallet. Zero open positions. Circuit breaker: CLEAR. Trading allowed.

STEP 2 — MARKET SCAN
Bitcoin trading at **$81,061**. EMA 9 above EMA 21 above EMA 200. RSI momentum at 55.7 (healthy zone). Regime: **STRONG_BULLISH**.

STEP 3 — RISK BOSS CALCULATION
1% of $204.83 = **$2.04 maximum risk**. Calculated contract size: 1 contract (= 0.001 BTC). Actual risk: only **$0.80 (0.39% of account)**. APPROVED.

STEP 4 — ORDER PLACED ON DELTA EXCHANGE
Market bracket order filled at **$80,957.50**. Simultaneously attached: Stop-Loss at **$79,355.40** and Take-Profit at **$81,760.10**.

STEP 5 — PRICE ROSE, BREAKEVEN UPGRADE TRIGGERED
Bitcoin moved to **$81,096.92** (+$139 profit per BTC). Bot cancelled old stop at $79,355, placed new stop at **$80,957.50 (your entry price)**.

CURRENT STATE — FREE ROLL!
Worst case: $0 loss (stop at entry). **Best case: profit at $81,760**. This trade can only make money now.

🔑 The 5 Golden Rules for Beginners

🧪 **Always Start on Testnet (Demo) First**
Keep `DELTA_ENVIRONMENT=testnet_india` in your .env file for at least 1–2 weeks. Watch the bot trade, check the results, build confidence. Only then switch to live.

🔐 **Never Enable "Withdrawal" on Your API Keys**
When creating API keys on Delta Exchange, only check **Read** and **Trade**. Never Withdraw. Even if your keys were ever leaked, funds could never leave your exchange account.

💰 **Never Touch the 1% Risk Rule**
Keep `MAX_RISK_PER_TRADE_PCT=0.01`. Even after 10 bad trades in a row, you would still have 90% of your money. Only increase this once you have at least 3 months of profitable history.

🛑 **Never Manually Cancel a Stop-Loss Without Replacing It**
The stop-loss is your safety airbag. If you remove it without putting a new one, one bad candle could wipe your entire position. If you want to adjust it, always place the new stop first.

🚨 **Know Your Panic Button**
If Bitcoin crashes suddenly or major news breaks, say in chat: "*Close all positions and cancel all orders immediately.*" The bot will instantly market-sell everything and cancel all pending orders.

❓ Frequently Asked Questions

Q. Can I lose more than 1% of my balance on a single trade?
No. The Risk Boss calculates contract sizes so that even if the stop-loss is hit, the maximum loss is capped at 1% of your available account balance. This is mathematically enforced before the order is placed.

Q. What happens if the exchange goes offline while I have an open trade?

Your stop-loss and take-profit orders are stored on Delta Exchange's matching engine, not on your computer. If your internet goes down or the bot stops, your protection orders are already in place and will still execute.

Q. Can the bot lose all my money?

The circuit breaker will halt all trading if your account drops 5% in a day. Between that and the 1% per-trade risk rule, even 10 consecutive bad trades would only reduce your account by roughly 10%, not wipe it out.

Q. Do I need to watch the screen while the bot trades?

No. Once a trade is placed, all the exit orders (stop-loss and take-profit) live on Delta Exchange's servers. You can close the app, your laptop, or even sleep. The exits will fire automatically.

Q. Which coins does the bot trade?

By default: Bitcoin (BTCUSDT), Ethereum (ETHUSDT), Solana (SOLUSDT), and Ripple (XRPUSDT). You can change the list in your .env file: `DEFAULT_SYMBOLS=BTCUSDT,ETHUSDT,SOLUSDT,XRPUSDT`

Q. What does "Free-Roll" mean?

After a trade moves into profit, the bot moves the stop-loss up to your exact purchase price. Now you have zero downside risk — if the market reverses, you exit at your entry and lose $0. If it continues, you hit the profit target.

✅ **You're Ready to Begin!**

Start with **Testnet + Interactive Mode**. Run `python main.py interactive` and simply type **y** or **n** when it asks you. Watch how it analyses markets, manages risk, and protects your capital. Once you are comfortable, switch to live trading or let Auto-Pilot run unsupervised.
